

**Thescanner**

- The heart of the scanner is the procedure `getSymbol ( )`, which finds the next valid symbol in a sequence of characters and stores it in a global variable (`symbol`).
- It internally uses two procedures `getCharacter ( )` and `findNextCharacter ( )`.
- `getCharacter ( )` simply reads the next character of the input stream and stores it into a global variable (`character`).
- `findNextCharacter ( )` is the implementation of whitespace.

getSymbol()

getCharacter()

findNextCharacter()

cais

# Sequence of Characters

- The procedure `getCharacter ( )` is used to read the next byte into the buffer.
- The return value is either the number of read bytes or 0, which indicates end of file (EOF).
- Any input file is nothing more than a **sequence of characters** to the scanner. It will even accept meaningless sequences as long as it consists of valid symbols in the specified language.

# The Scanner

- The heart of the scanner is the procedure getSymbol(), which finds the next valid symbol in a sequence of characters and stores it in a global variable (`symbol`).
- It internally uses two procedures getCharacter() and findNextCharacter().
- getCharacter() simply reads the next character of the input stream and stores it into a global variable (`character`).
- findNextCharacter() is the implementation of whitespace.
